CLIENT FEATURE REVIEW / VERSION 1.3

ISP Operations System

A clearer way to manage field work, equipment, subscriber loading, and customer support.

Prepared by Reinier Adrian Luna
Developer | Updated October 29, 2026

PURPOSE OF THIS DOCUMENT

Please review whether the features match your daily operations. You can request additions, removals, or changes before we finalize what will be built.

What the system brings together

Field operations	Subscriber service
Installation and repair job orders	Customer accounts and load packages
Technician schedules and work updates	Payment QR codes and payment proof
Equipment issued, used, and returned	Loading request processing and history
Attendance, absence, leave, and payments	Payables ledger and owner oversight

How to use this guide

Pages 2-12 explain accounts, features, and workflows. Page 13 sets the scope; page 14 is the review checklist. Pages 15-16 show the revised PHP 47,000 payment plan.

Proposed detail marks a suggested rule for review; For review marks an open choice. This is a review draft, not a signed approval. New features: package rebate profit, support tickets, and client load activity with a 60-day dormant period. Delivery dates will be agreed separately.

01 / ACCOUNTS & OVERSIGHT

Who will use the system?

Each person signs in to an account with access suited to their responsibilities. There will be one super admin and multiple admins.

Account	Main responsibility
Super admin	Oversee operations and view the full history of changes made by all users.
Admin	Manage jobs, equipment, staff, subscribers, loading, leave decisions, and business payables.
Technician	Handle today's assigned jobs, report work and materials, check in/out, and file absence reasons or leave.
Customer / subscriber	Choose a load package, upload payment proof, and track personal requests.

Super admin: operational oversight

The super admin can use admin features and oversee jobs, stock, staff, customers, loading, rebate profit statistics, support tickets, client activity, technician payments, leave, and payables.

Super admin: full change history

Only the super admin can open the **audit trail**, which is the system-wide history of changes. It shows who made a change, when it happened, which record was affected, and what changed.

For example: an admin reschedules a repair, verifies a load payment, approves leave, or marks a ledger item paid. These actions remain traceable. Changes by the super admin are recorded too.

> **PROPOSED ACCESS RULE**
>
> Only the super admin creates or disables admin accounts and authorizes exceptional corrections to finalized records. Please confirm which admins may see payroll and edit payment QR codes or load packages.

The customer loading and support view uses the existing account-number-only access method. Staff accounts use credentials. Technicians see details needed for their assignments. Disabling an account preserves past records.

02 / ADMIN

Create, schedule, and review jobs

A job order is a record for an installation or repair. It connects the subscriber, assigned technician, work updates, and materials used.

Create installation or repair jobs
Select the subscriber and enter the service address, contact details, issue or instructions, and scheduled date. Each job receives its own reference number.

Plan the week and assign one technician
Admins can schedule a full week in advance. Each job has exactly one assigned technician, who can see and work on today's assignments only. Admin can reassign a job when needed.

Find and follow up on work
Search or filter jobs by date, type, subscriber, technician, or status. Open a job to review its remarks, materials, and previous decisions.

Example: from assignment to closure

01 **Admin creates the job**
A repair is scheduled and assigned to one technician.

02 **Technician performs the work**
On the scheduled day, the technician opens the job, records remarks, and reports materials used.

03 **Technician submits for review**
The job shows as pending review. Submission alone does not close it.

04 **Admin checks and decides**
Approve and close, request corrections, arrange another visit, or cancel with a reason.

> **COMPLETED WORK STILL NEEDS REVIEW**
>
> The admin reviews the reported outcome, remarks, and materials before final closure. An unsuccessful visit is recorded with a reason and handled separately from a successfully completed job.

Confirmed update: No multi-technician teams, lead assignment, or technician job-photo uploads. The technician submits work updates without attachments.

03 / ADMIN

Account for every component

Track equipment and supplies coming in, going to technicians, being used on jobs, and returning to storage.

Record incoming stock
Maintain a list of routers, cable, connectors, and other components. Record quantities in the appropriate units, such as pieces or meters.

Record items handed to technicians
Select the technician, items, and quantities. Issued items remain assigned to that technician until their use, return, or other outcome is recorded.

Connect usage to the job
Technicians report what they used. Items awaiting job review are held against that submission so they cannot be claimed for another job. Admin approval confirms the final usage.

Check returns and differences
Record unused items physically returned. Missing or damaged items and unexplained differences remain visible for staff to resolve.

Example: five routers issued

What happened	Quantity	Meaning
Handed to the technician	5	All five are now with the technician.
Approved as installed on jobs	3	These are recorded against the relevant jobs.
Still with the technician	2	These remain their responsibility.
Later returned and received	2	The two go back into available stock.

> **HANDING OUT STOCK IS NOT THE SAME AS USING IT**
>
> After three routers are installed, the other two are still with the technician. They return to available stock only when the return is recorded and confirmed.

For review: Do individual routers need serial-number or MAC-address tracking? Also confirm how to handle transfers, damaged items, and equipment removed from customer locations.

04 / ADMIN

Manage people and records

Keep technician and subscriber information connected to the work and transactions they belong to.

Technician profiles and account access

Creating a technician profile also creates their login access. The profile brings together contact details, assigned and completed jobs, equipment issued and returned, attendance, absence reasons, leave requests, login history, and recorded payments.

Proposed detail: Give the technician a temporary password and require a change on first use. Admin can reset or disable access without removing past work history.

Attendance: check-in and check-out

Technicians can check in when starting work and check out when finished. Admin can review the recorded times and identify missing check-outs. Logging in to the system is recorded separately and does not automatically start attendance.

> **INCLUDED FOR NOW**
>
> Attendance is included provisionally and can be removed if it is unnecessary. It will not automatically calculate pay or determine whether a technician can open an assigned job.

Technician payroll payment records

Record payments already made to technicians for the 15th and 30th payment cycles. Each entry includes the technician, covered period, amount paid, actual payment date, payment method, and optional reference, receipt, or notes.

This is a payment record, not an automatic salary calculator or bank transfer service. If a period has no entry, the system shows that no payment has been recorded; it does not calculate an amount owed.

Subscriber records and customer accounts

Admin creates each subscriber with an account number, name, contacts, and address. The account-number-only customer view links jobs, loading history, support tickets, and activity status: Active, Dormant (60 days), or No Load. Customers cannot self-register.

For review: Confirm staff password handover/recovery, which admins may view payroll, and payment dates for February or adjusted paydays.

05 / TECHNICIAN

A clear view of today's work

The technician view focuses on assigned field work and the information needed to report what happened.

Feature	What the technician can do
Today's assignments	See assigned installation/repair jobs, addresses, contacts, and instructions. Each job has one technician. Future jobs stay hidden.
Work progress	Mark work started and report whether the work was completed or could not be completed.
Absence and leave	File an absence reason or leave request. Admin approves or rejects leave, and the technician sees the decision.
Materials used	Report the actual equipment and supplies used from issued stock.
Submit and correct	Send the report for admin review and respond to requested corrections.
Check in / check out	Record attendance separately from signing in to the account.

What the job statuses mean

Assigned: Scheduled and given to one technician.
In progress: Work has started.
Pending review: The report has been submitted to admin.
Changes requested: Admin needs a correction or more information.
Closed: Admin has approved the final result.
Cancelled: Admin has stopped the job, with a reason.

> **IF THE WORK CANNOT BE FINISHED**
>
> The technician records the reason in remarks. No photo or evidence upload is required. Admin reviews the report and decides whether to reschedule or take another action. The visit is not recorded as a successful installation or repair.

File an absence reason or request leave

For an absence, submit the affected date and explanation. For leave, enter the requested dates and reason, then follow its Pending, Approved, or Rejected status. Admin handles any affected job schedules; leave does not automatically change pay.

For review: Confirm half-day leave, changes after approval, access to past completed jobs, and correction of reports after the scheduled date.

06 / CUSTOMER

Request load and track progress

Customers can request load and open support tickets from their subscriber view. Loading requests and tickets are linked to their account; the support workflow is explained on page 10.

01 **Enter the account number**
Use the subscriber account number created by admin. No customer password or public registration is required.

02 **Choose a load package**
Select from the available options and review the price and included terms.

03 **Pay using the displayed instructions**
View the payment QR code and recipient details, then make payment through the relevant payment app or channel.

04 **Upload proof and submit**
Attach the payment receipt. The system checks request limits and duplicates before creating a request reference.

05 **Follow the request**
Open the current status, any admin response, and the history of previous loading requests.

What customers can see

The request details include the chosen package, amount, payment proof, submission date, current status, and relevant admin response. Rejected requests include a reason so the customer understands what needs attention.

> **PAYMENT RECEIVED AND LOAD COMPLETED ARE DIFFERENT**
>
> A payment-verified status means admin checked the payment. A completed status means staff also performed the loading through the existing ISP system and confirmed the result.

Protection against repeated requests

Repeated taps must not create several load requests. Too many submissions trigger a wait-and-retry message. Reused receipts are blocked or flagged for admin review; uploading proof does not automatically confirm payment.

Confirmed access: Anyone who knows an account number can open the associated loading view. The client has accepted this access method.

07 / ADMIN

Process loading and payments

Staff continue to load internet through the existing ISP system. This web app keeps the customer request, payment check, and loading outcome organized.

Set up load packages and payment QR codes

Manage packages with name, price, rebate amount, description, and duration where applicable. Set QR images, recipient details, and payment instructions. Package rebates become profit on the statistics page after completed loading (page 9).

Unavailable options can be hidden. Each request preserves the package price, rebate, and payment instructions used when submitted; later changes apply to new requests.

Handle each request

01 **Review the request and payment**
Check the subscriber, selected package, amount, uploaded proof, and actual receipt of payment.

02 **Verify or reject**
Mark payment verified after checking it, or reject with a customer-readable reason.

03 **Perform loading externally**
One processing admin handles the request and loads the subscriber in the existing system.

04 **Record the result**
Mark completed only after confirming success. If loading fails or is uncertain, record an issue and investigate before retrying.

Customer status	Plain meaning
Pending verification	Waiting for the payment check.
Payment verified / Processing	Payment checked; loading is next or in progress.
Completed	Loading was performed and confirmed.
Rejected / Fulfillment issue	Payment was rejected with a reason, or loading needs staff attention after verified payment.

Load-request checks: Check duplicate receipts/payment references across requests. Exact repeats must not be processed twice. Uncertain matches need manual review, and legitimate corrections need a controlled resubmission path.

08 / ADMIN & STATISTICS

Package rebates and profit

Admins can set a rebate amount for each load package. The rebate is the profit earned when a load is completed successfully.

Set the rebate for each package

Package settings include the selling price and a fixed rebate amount in PHP. Admin can add or update the rebate separately for each package; different packages may earn different amounts.

Example package	Customer pays	Rebate / profit
999 package	PHP 999	PHP 99
10 completed loads of this package	PHP 9,990 in sales	PHP 990 in profit

Show earnings on the statistics page

The admin statistics page shows completed load count, total load sales, and total rebate profit. Filter by completion date range, package, or subscriber, and view a package breakdown with its completed loads and earned rebates.

Count profit after confirmed completion

A pending request, verified payment, rejected request, or unresolved loading issue does not earn profit yet. Count each completed load once. If a completed load is later reversed through an authorized correction, remove its rebate from the profit total and retain the correction history.

Preserve the rebate used by each request

Store the package price and rebate with the request when submitted. Later package changes apply to new requests and do not rewrite past earnings. Rebate-setting changes and corrections remain visible in the super admin change history.

> **THE REBATE IS THE RECORDED PACKAGE PROFIT**
>
> For the PHP 999 package with a PHP 99 rebate, statistics records PHP 999 in sales and PHP 99 in rebate profit per completed load. This figure does not deduct other business expenses.

Proposed detail: Rebate amounts must be zero or more and cannot exceed the package selling price. Confirm which admins may change rebates or view profit statistics.

09 / CUSTOMER & ADMIN

Support tickets and requests

Customers can open a support ticket from their subscriber view. Admins can review the request, respond, manage its status, and follow it through resolution.

Customer: open and follow a ticket

Enter the subscriber account number using the existing customer access method, open Support, enter a subject and describe the issue or request, then submit. The system creates a ticket reference and submission date linked to that subscriber.

Customers can see tickets linked to their own subscriber account, read admin replies, add follow-up details, and check the current status and status history.

Admin: review, respond, and update status

The admin ticket list shows the reference, subscriber, subject, submission date, latest update, and status. Search or filter by subscriber, date, or status. Open the ticket to read the request, reply to the customer, and update its status.

Ticket status	Meaning
Open	New request waiting for admin review.
In progress	Admin is handling the issue or request.
Resolved	Admin has recorded the solution or response.
Closed	Admin has finalized the ticket.

Keep the customer informed

Record replies and status changes with who made them and when. Customers see the updates inside the web app. A ticket that needs an on-site visit can be referenced in a separate installation or repair job created by admin; it does not automatically create or close a job.

> **TICKETS HAVE THEIR OWN WORKFLOW**
>
> Support ticket status is separate from job status and load-request status. Admin can manage a customer request even when there is no loading transaction or field visit.

For review: Confirm whether customers may reopen a resolved or closed ticket. Automatic SMS, email, push alerts, attachments, and service-level timers are outside this ticket scope unless separately agreed.

10 / ADMIN & SUBSCRIBERS

Client status from load history

The system determines each client's activity status from their most recent successfully completed load. The dormant period is 60 days.

Client status	Rule
No Load	The client has no successfully completed load in their recorded history.
Active	The client has a completed load and fewer than 60 days have elapsed since their latest completed load.
Dormant	60 days or more have elapsed since the client's latest completed load.

Show activity where admins manage clients

The subscriber list and client profile show the activity status, last completed load date, last package, and days since the last completed load. For clients with no completed load, show No Load and leave the last-load fields empty. Admin can filter the client list by Active, Dormant, or No Load.

Update the status as time and history change

Recalculate status as time passes, so a client becomes Dormant at the 60-day boundary even without a new request. A new completed load updates the last-load date and returns the client to Active. A first completed load changes No Load to Active.

Pending, rejected, payment-verified, or failed loads do not reset the clock. If a completed load is reversed, use the most recent remaining valid completed load; if none remains, show No Load.

Example: the 60-day boundary

A client whose latest completed load was 59 days ago is Active. At 60 elapsed days the client is Dormant. A client who has submitted requests but has never had a successful completed load remains No Load.

> **ACTIVITY STATUS DESCRIBES LOADING HISTORY**
>
> Dormant and No Load help admins identify clients for follow-up. These labels do not measure internet connectivity or automatically activate, suspend, or disconnect service.

Confirmed in this revision: Dormant begins at 60 days since the latest completed load. For review: Confirm whether historical completed loads will be imported before the system goes live; without those records, existing clients may appear as No Load.

11 / ADMIN LEDGER

Track what needs to be paid

Record business payables and keep upcoming or overdue payments visible on the admin home screen until they are marked paid.

Create a payable item

Enter what needs to be paid, its due date, and a reminder choice of **3 days or 5 days before the due date**. Suggested supporting details include the payee, amount, and notes. Admin can search the ledger and filter paid or unpaid items.

Persistent home-screen notices

When the item is unpaid	What the admin sees
Before the selected reminder window	The item stays in the ledger, without a due notice yet.
Within the selected 3 or 5 days	An upcoming-payment notice with the item and due date.
On the due date	A due-today notice.
After the due date	An overdue notice that stays visible until payment is recorded.
After it is marked paid	It leaves unpaid notices but remains in paid history.

Example: a bill due October 30

Choose **5 days** and the notice begins October 25. Choose **3 days** and it begins October 27. If it is still unpaid on October 31, the notice shows it as overdue. Passing the due date does not remove the reminder.

Record payment and retain the history

Pay through the usual external method, then mark the item paid and record the actual payment date. Changes to due dates, reminder choices, and payment status are recorded in the change history. A newly entered overdue item appears immediately.

> **A REMINDER, NOT AN AUTOMATIC PAYMENT**
>
> The ledger does not send money or automatically settle bills. It is separate from technician payment records. Notices are inside the admin web app; SMS and email reminders are not included.

For review: Confirm whether payee and amount are required, and who may correct an item mistakenly marked paid. Recurring bills and partial payments need separate agreement.

12 / SCOPE & RECORD KEEPING

What this version covers

These boundaries include the newly requested features and help confirm expectations before development begins.

Included in this version	Requires a separate scope discussion
Single-technician jobs, remarks, materials, admin review, and history.	Team assignments, technician job attachments, GPS, or offline work.
Equipment receipts, issuance, usage, returns, and stock checking.	Purchasing/supplier accounting or advanced recovery workflows.
Load requests, manual payment checks, external-loading result records, QR codes, and receipt uploads.	Automatic activation/disconnection, connection monitoring, payment gateways, or automatic refunds.
Attendance, absence, approved leave, and technician payment records.	Salary calculations, leave balances, deductions, or bank payouts.
Admin-created subscribers, account-number-only access, request protection, and client activity labels with a 60-day dormant period.	Customer passwords/OTP, public sign-up, or guaranteed detection of every altered receipt.
Package rebate settings and completed-load profit statistics.	Full accounting, expense-based net profit, or automatic rebate payouts.
Customer support tickets, admin replies, ticket statuses, and history.	Ticket attachments, service-level timers, or automatic field-job creation.
Payables ledger, 3/5-day reminders, and persistent unpaid notices.	Automatic bill payment, recurring bills, or partial payments.

Keep records clear and private

Important changes record who made them and when. Approved records keep their history; corrections require an explanation. Staff access is restricted by role, and passwords are not shown in activity records. Payment proofs stay linked to loading records. Technician job photos are not collected.

Avoid duplicate requests, repeated stock deductions, duplicate rebate earnings, and conflicting admin processing. Staff still verify external payment and loading results. Receipt retention, request limits, correction permissions, and historical data handling remain for review.

> **STATUS UPDATES ARE INSIDE THE WEB APP**
>
> Loading progress and support ticket updates appear in the customer view. Automatic SMS, email, and push notifications are outside this version.

13 / YOUR REVIEW

Does this match your operations?

Review the feature groups below and identify anything to keep, change, remove, or add. A short explanation or real example is enough.

Feature group	Keep / change / remove
Accounts and super admin oversight	
Job orders, scheduling, single-technician work, and admin closure	
Equipment issuance, usage, returns, and stock checking	
Staff profiles, attendance, absence, leave, and payments	
Subscriber accounts, packages, payment proofs, and load tracking	
Payment QR settings, request protection, and loading processing	
Package rebates and profit on the statistics page	
Customer support tickets, admin responses, and ticket status	
Client activity status: Active, Dormant (60 days), and No Load	
Payables ledger and persistent 3/5-day reminders	

Updated in this revision

Added package rebates and profit reporting, customer support tickets, and client status from completed load history. Dormant begins at 60 days. The revised contract price is **PHP 47,000**, including PHP 2,000 for the additional features.

Existing agreed features remain: account-number-only customer access; duplicate receipt checks and request limits; one technician per job; no technician job evidence uploads; admin leave approval; and persistent 3/5-day ledger reminders.

Details still to confirm

Rebate-editing and statistics permissions; ticket reopening; historical load imports; and the payment timing for the additional PHP 2,000. Other open operational details from the earlier pages remain for review.

Reviewed by: _____ Date: _____

Your feedback will update the feature list. The payment schedule follows on pages 15-16. Delivery dates and remaining operational details will be agreed separately.

14 / PAYMENT TERMS

A milestone-based payment plan

The revised contract price is PHP 47,000, including PHP 2,000 for the additional features. The existing down payment and eight milestones remain; the added fee is listed on page 16.

Project amount	Down payment	Remaining balance
PHP 47,000	**PHP 5,000**	PHP 42,000

After the PHP 5,000 down payment, the balance is PHP 42,000: eight PHP 5,000 milestones plus PHP 2,000 for the added features. Timing for the extra PHP 2,000 remains for agreement.

Start-up payment and milestones 1-4

Payment	Features / payment point	Amount
Down payment	Payable before development begins, after agreement on the project scope and payment plan.	PHP 5,000
Milestone 1 Accounts and profiles	Super admin, admin, and technician access; technician profile/account creation; subscriber records and account-number-only customer access. Foundation for restricted access and change records.	PHP 5,000
Milestone 2 Job orders and scheduling	Installation/repair job creation; weekly scheduling; one technician per job; today-only technician work view; progress, remarks, and submission for review. No job-photo uploads.	PHP 5,000
Milestone 3 Inventory and job closure	Component stock-in, issuance, reported usage, pending-review quantities, returns, and stock checking. Admin reviews, requests corrections, reschedules, or closes jobs with confirmed usage.	PHP 5,000
Milestone 4 Staff attendance and payments	Check-in/check-out; absence reasons; leave filing and admin approval/rejection; technician job/login history; records of technician payments for the 15th/30th cycles.	PHP 5,000

HOW EACH MILESTONE PAYMENT WORKS

For milestones 1-8, payment becomes due after the listed features are completed, demonstrated, and accepted by the client. The payment covers that milestone; the next PHP 5,000 is tied to the next milestone.

Amounts are in Philippine pesos (PHP). The sequence groups related features; detailed development and review dates will be agreed separately.

15 / PAYMENT TERMS

Milestones 5-8 and handover

The remaining stages include customer loading, rebates, activity status, support tickets, payables, and review of the full system.

Payment	Features / payment point	Amount
Milestone 5 Customer loading	Package and QR settings; package rebate settings; customer selection, payment instructions, receipt upload, request reference, personal history, and repeat-submit protection.	PHP 5,000
Milestone 6 Loading and statistics	Payment verification/rejection, processing ownership, external-load results, request protection, and controlled corrections. Completed-load rebate profit statistics and client activity status with the 60-day dormant rule.	PHP 5,000
Milestone 7 Tickets and oversight	Customer support tickets, admin replies and statuses; payables ledger with 3/5-day persistent notices and paid history; super-admin-only change history across agreed modules.	PHP 5,000
Milestone 8 Checks and handover	Review job, stock, leave, loading, rebate, ticket, client-status, and ledger workflows. Check access, mobile use, duplicates, reminders, profit totals, and the 60-day boundary; resolve agreed-scope issues and provide handover.	PHP 5,000

Revised payment summary

Payment group	Calculation / timing	Amount
Down payment	Existing start-up payment	PHP 5,000
Feature milestones	8 x PHP 5,000	PHP 40,000
Additional features	Rebates, tickets, and client status; payment timing to be agreed.	PHP 2,000
Total contract price	PHP 45,000 + PHP 2,000	PHP 47,000

Review before moving forward

Each milestone is demonstrated and reviewed against the agreed scope. Once accepted, its PHP 5,000 payment is due before the next stage; the final milestone payment follows acceptance of milestone 8. The separate PHP 2,000 additional-features payment has no due date set in this draft.

The additional PHP 2,000 is included in the PHP 47,000 total. Future scope changes, delivery dates, hosting, domain, and other third-party running costs require separate agreement.
